Microsart® RESEARCH Bacteria

Rapid detection of total bacteria within 2½ h

User Benefits

- >95 % of all known bacteria detected in one test
- fast: only 2½ h time-to-result
- reliable: highly specific TaqMan® probes
- easy to use
- less pipetting effort
- no sample preparation mandatory

Product Information

Microsart® RESEARCH Bacteria is used for fast and reliable direct detection of bacterial contamination in cell cultures, cell culture supernatants and cell media components in research and development or whenever there is no need for regulation conform testing (i.e. according to EP/USP/JP).

Kit Components and storage
Each kit contains all reagents for 25 or 100 reactions. 4 color-coded tubes, with master mix, buffer, positive control and negative control, make the handling as simple as possible.

The expiry date and the storage conditions of the unopened package are noted on the package label. The kit components are stored until use at +2°C to +8°C and must be stored after rehydration or opening at < -18°C.

Please note: The master mix, also called RESEARCH Bacteria Mix, should be protected from light all the time.

Test Principle
Microsart® RESEARCH Bacteria utilizes real-time PCR. The detection procedure can be performed within 2½ hours, including less than ½ hour hands-on time. In contrast to the detection by cell cultivation method, samples do not need to contain vital bacteria.

The assay can be performed with any type of real-time PCR cycler able to detect the fluorescence dyes FAM™ and ROX™.

Bacteria are specifically detected by amplifying a highly conserved 16S rRNA coding region in the bacterial genome. The amplification is detected at 520 nm (FAM™ channel). The kit includes primer and FAM™ labeled probes which allow the specific detection of more than 95 % of all known bacterial species so far described as contaminants of cell cultures and media components. Eukaryotic DNA is not amplified by this primer | probe system.

False negative results due to PCR inhibitors or improper DNA extraction are detected by the internal amplification control which is part of the PCR master mix. The amplification of the internal amplification control is detected at 610 nm (ROX™ channel).

For PCR support and recommendation please contact PCR@Sartorius.com.
**User-supplied equipment and material**

- DNA-free PCR reaction tubes for the specific qPCR device
- Microcentrifuge for 1.5 ml reaction tubes, i.e. Centrisart A-14, Order No. A-14-1EU
- Pipettes with DNA-free filter tips to prepare and dispense the reaction mix (10, 100 and 1000 μl)
- Optional: For DNA extraction we recommend our Microsart® Bacteria Extraction kit, Order No. SMB95-2001
- qPCR device with filter sets for the detection of the dyes FAM™ and ROX™ and suitable for 25 μl PCR reaction volumes*

* Sartorius collaborates with Agilent. In case there is no access given to a qPCR instrument, Agilent provides the AriaMx qPCR System for comprehensive testing of Sartorius’ qPCR kits.

AriaMx Real-time PCR System from Agilent
